

ED Patient Flow Description

The conversational ED-flow description used in the demo, the same way Priya would describe her department to a colleague.

The description

Here is roughly how a patient moves through our emergency department. They arrive and check in at the front, go to triage for vitals and an acuity level, then usually to registration, then they wait for a bed, then a nurse assessment, then the physician sees them, then tests and results.

Sick patients skip registration and register at the bedside. Low-acuity patients can take a separate fast-track path.

What to notice: the flow has a clear start (arrival) and a clear end (tests and results); acuity assessment at triage is a decision point that splits the path; two branches break the straight line (bedside registration for sick patients, fast track for low-acuity patients); 'wait for a bed' is phrased as a wait, a likely delay worth flagging. When AI draws the flowchart, check the split at triage, the two branches, and the flagged waits first, and refine conversationally if any are missing.
