

# Bed-ownership process description

*The rough, conversational description of the new charge-nurse bed-ownership process that Priya feeds to AI in the SOP demo.*

## The process, in plain language

The moment an emergency department doctor decides to admit a patient to the hospital, the charge nurse on duty is in charge of getting that patient a room upstairs. They note the time the decision was made, ask the unit upstairs for a room right away, and check back every thirty minutes until a room is assigned. If no room is free within two hours, they raise it to the house supervisor, the senior nurse who oversees the whole hospital that shift. And when one shift ends and the next begins, the charge nurse going off duty hands any room requests that are still open to the charge nurse coming on.

Key elements buried in the description: Trigger, the moment an admit decision is made. Owner, the charge nurse on duty. Actions, note the time, request a room immediately, check back every thirty minutes. Escalation, raise to the house supervisor if no room within two hours. Handoff, open requests pass to the next shift's charge nurse.
