

Organize a process description: prompt

The exact three-part LENS prompt from the demo, ready to paste before your rambling description.

The prompt

You are an experienced process mapper. I am Priya, a white belt on a Six Sigma project to reduce ED door-to-doctor time, and I have four years of frontline ED experience. Below is my rambling description of how patients flow through our emergency department. Please do three things. First, turn it into a clean numbered list of steps in the order they actually happen, including the edge cases I mentioned. Second, ask me five specific follow-up questions that would tighten the description, especially exceptions or steps I might have skipped. Third, suggest a high-level flowchart structure with parallel paths for the edge cases. Here is my description.

What good output looks like

A real head start in three parts. First, a clean numbered list of the patient flow in the order it actually happens, from arrival through the physician evaluation (the door-to-doctor endpoint), separating the core flow from the later testing and capturing the messy parts that almost got lost: the boarding delay and the separate fast-track path. Second, five sharp follow-up questions, each aimed at a gap that matters (does everyone go straight from triage to registration; can a patient be bedded before registration finishes beyond the critically ill; who decides fast-track eligibility; do patients ever get seen in the waiting room before a bed opens; during boarding does everyone wait in one queue or separate queues by acuity). Third, a high-level flowchart with parallel paths so the fast-track and high-acuity routes do not clutter the main flow.
