

Compile VOC: prompt

The exact structured compile prompt from the demo, with the constraints repeated more than once because they do all the work.

The prompt

You are a Lean Six Sigma expert. I am Priya, a white belt on a project to reduce ED door-to-doctor time at our regional health system. Below are three sources of patient voice: a satisfaction survey export, a complaint log, and a patient relations email archive. Please compile them into one tidy reference document with this structure. Section one, survey responses, in their original order, each numbered, the original wording preserved in quotation marks, with the satisfaction rating in parentheses after each quote. Section two, complaint log entries, in original order, each numbered, wording in quotation marks, with the complaint category as recorded in the log. Section three, patient relations email replies, in original order, each numbered, with the key patient concern in quotation marks. Do not cluster. Do not theme. Do not interpret. Compile only. Each patient voice should appear once, in the section that matches its source. Here are the three sources.

What good output looks like

Three clean sections, twenty-five numbered items, each in the patient's own words, organized strictly by source: survey responses with their ratings, complaint entries with their categories, and email replies with the key concern. The AI opens by stating that it preserved the original order and wording with no clustering or theming. Verbatim wording is kept intact, not tidied (for example, the chest-pain comment about waiting almost three hours stays exactly as written rather than being collapsed into long wait). The result is the raw voice made tidy and complete, ready for the team to theme later in the Analyze phase.
