

Build and Read a Histogram Card

The exact prompt used in the demo to turn 200 ED door-to-doctor times into a histogram AI reads back.

The prompt

You are a statistics tutor. I am Priya, a white belt on a project to reduce ED door-to-doctor time. Here are the door-to-doctor times in minutes for two hundred patients. Please create a histogram so I can see the distribution. Choose sensible buckets for me. Then describe the shape of the distribution in plain English, and tell me if you see anything I should investigate, like skew or more than one peak.

What good output looks like

AI groups the 200 times into clean buckets (zero to fifteen minutes, fifteen to thirty, and so on) and draws the chart, then reads it back: the distribution is bimodal, with a large peak in the first fifteen minutes that falls away by thirty and a second smaller peak out around ninety to a hundred and twenty minutes, with almost nobody in between. It explains that a bimodal shape often means two different types of work or conditions are mixed together and suggests investigating what distinguishes the slow group from the fast group. It finds the pattern; Priya supplies the meaning (the fast peak is low-acuity fast-track patients, the slow peak is high-acuity patients stuck waiting for a bed during boarding).
