

Build a Pareto card

The exact demo prompt that turns 300 short free-text ED delay notes into a categorized, sorted Pareto chart with a cumulative line and the roughly 80 percent set named.

The prompt

You are a Lean Six Sigma expert. I am a white belt on a project to reduce ED door-to-doctor time. Here are three hundred short free-text notes on what most delayed each patient. Please group them into a small set of sensible categories, count how many fall into each, and create a Pareto chart with the categories sorted from most frequent to least, plus a cumulative percentage line. Then tell me which categories make up roughly the first eighty percent of the volume.

What good output looks like

AI reads the messy free text and proposes five clean categories: Bed Wait and Boarding, Triage Backlog, Lab and Imaging Turnaround, Physician Availability, Registration Delay. It counts each, sorts the bars tallest to shortest, and adds the rising cumulative line. In plain words: Bed Wait and Boarding is the tallest bar at just over forty percent of all delays; add Triage Backlog and you are at about sixty five percent; add Lab and Imaging Turnaround and you cross eighty percent. So three categories explain over four fifths of delays, and the top two alone are nearly two thirds, the vital few. Registration Delay, despite being frequently complained about, is only about seven percent. Priya still sanity checks the categories and weighs cost and effort, because the AI ranks by size but does not decide what to fix.
