

Draft a response plan

The exact demo prompt: describe the situation in plain language and ask AI to format it as a real control-plan response table plus a response log, on one page.

The prompt

You are a Lean Six Sigma expert. I am Priya, a white belt. Help me write a simple response plan for our control chart. Every morning we look at a control chart of the average time it takes a patient to be seen by a doctor in our emergency department. The lead charge nurse is the one who checks it. We treat it as a signal if any point lands outside the limits, or if eight points in a row sit on one side of the center line. When that happens, I want the lead charge nurse to look into the cause, starting by checking whether the procedure we wrote for getting admitted patients a room upstairs is actually being followed, then tell the ED operations manager, write down what they found and what they did about it, and confirm the chart settles back to normal. Please format this the way it would appear in a real control plan: a short purpose line, then a response plan TABLE with columns for Signal, First Check, Who to Notify, Corrective Action, and What to Record, followed by a simple response log table the team can fill in when a signal occurs. Keep it to one page.

What good output looks like

In under a minute AI returns the exact structure the lecture walks through: a one-sentence purpose line at the top (keep ED door-to-doctor time stable and make sure no chart signal goes unanswered); a response plan table with one row for each of the two signals (any point outside the limits; eight points in a row on one side of the center line) and the five columns filled in, Signal, First Check (the room-request procedure), Who to Notify (the ED operations manager), Corrective Action, and What to Record; then a blank response log underneath ready for the first entry. It even adds a sensible reminder not to overreact to a single point that is actually still inside the limits. Priya then grounds it in reality, putting in the actual names and roles, confirming those people have the time and authority, and setting a checking schedule the team can keep. The AI builds the table in seconds; Priya makes it real.
