

Priya's Quick Win

How one terrified white belt used AI to walk into a high-stakes meeting prepared instead of panicked.

The Story

Priya, twenty eight, works in operations at a regional health system. She is added to a Six Sigma project as a white belt, asked to help reduce emergency room wait times across three hospitals. The green belt sends her six charts and an email full of terms like CTQ, DPMO, and process capability. She reads it three times and understands none of it, with a steering committee meeting looming the next morning.

The Quick Win

At five in the morning she opens ChatGPT and pastes the email, asking AI to explain it like she has never taken a Six Sigma course. Forty seconds later she has a plain language translation. She pastes a chart, learns what it means for an emergency department person, and by six thirty she has read the whole pack and written three sharp questions.

Why It Matters

In the meeting the chief medical officer wants to hear from someone who actually works the floor. Priya explains the chart and ties it to a pattern she sees every Tuesday afternoon. Two weeks later she is given a bigger role. The skill that powered her morning is exactly what this course will practice.

Remember this

AI can turn a terrified white belt into the most informed person in the room.
