

The Control Phase

Lock in your gains with permanent guardrails so the problem never returns.

The Goal

Control is the final DMAIC step. The solution works, but the job is not done, because it is human nature to slip back into old habits. Without strict controls, the busy kitchen staff will eventually go back to baking pizzas too early just to clear them out.

Lock In The Gains

To hold the gains you update the standard operating procedures. You officially rewrite the kitchen training manual and might add a wall dashboard tracking pizza wait times in real time. If any pizza sits more than five minutes, an alarm sounds so the manager fixes it before a customer gets a cold meal.

Why It Matters

These permanent guardrails make your improvements last forever. Looking back, the whole roadmap is simple, you found what was broken, measured the damage, hunted the cause, tested a fix, and locked it in so the problem never happens again.

Remember this

Control turns a one-time fix into a permanent gain by writing it into the way you work.
