

The LENS Framework

Four prompt ingredients that turn vague requests into professional-grade answers.

Why Not Search

The biggest mistake people make is treating AI like a search engine, typing vague keywords and expecting a customized result. Because the tool is a predictive text engine, a vague request only produces a generic, predictable response. To get consistent, professional results you use a framework called LENS that gives the AI the structure it needs.

What LENS Stands For

L stands for Lead with the Persona, telling the AI which expert to become, like a Master Black Belt or auditor. E stands for Establish the Context, painting your specific world, your job, your project. N stands for Name the Task with strong action verbs and a clear finish line. S stands for Set the Constraints, like word count, tone, or jargon to avoid.

How To Use It

Compare the prompts. A weak prompt, Tell me about Lean, is missing all four ingredients and returns generic noise. A strong LENS prompt asks the AI to act as a master instructor, explain Lean's eight wastes to a new white belt at a regional bank in three paragraphs with banking examples and no jargon. The tool is identical, but the framework changes everything.

Remember this

LENS, Lead with the Persona, Establish the Context, Name the Task, Set the Constraints, turns vague prompts into custom results.
