

Choosing The Right Solution

The most common failure is not a lack of ideas, it is grabbing the wrong idea too quickly.

Attack The Root

Your solution must attack the root cause from the Analyze phase, not the symptom. For a late report whose real cause was an unowned data handoff, telling the writer to work faster is a symptom fix. Assigning ownership and a deadline is the root cause fix. One makes the problem stop, the other just adds stress.

Favor Simplicity

The best solution is the simplest one that solves the problem, because simple fixes are cheaper, faster, easier to maintain, and less likely to break. Often the strongest fix is humble, a checklist or moving two confusable products apart. If a simple change and a complex change both work, the simple one wins.

Think About Consequences

Every change ripples. A fix that speeds your step might dump work on the next person. Before committing, ask what else might happen, who else is affected, and could this create a new problem downstream. AI can brainstorm options and play devil's advocate, but you make the call on what is feasible here.

Remember this

Does it hit the root cause, is it as simple as possible, and what are the side effects.
