

Why You Need A Response Plan

A control chart can sound the alarm, but it cannot tell you who should answer it.

The Gap

A smoke detector only helps if someone hears it and acts. A chart tells you something changed, but not who should be watching, what counts as a real alarm, or what to do when it goes off. A signal that triggers no response is worse than no chart, because it gives a false sense of safety.

Four Plain Questions

A good response plan answers four things in writing. What are we watching and how often. Who is responsible, one named person, because everyone means no one. What exactly counts as a signal, like a point outside the limits or a run of eight on one side. And what are the first steps when a signal appears.

Where AI Fits

Writing a clear, organized response plan is exactly what AI does well. Describe your process, the number you track, and who is involved, and it lays out a clean plan in moments. But it cannot know who should own the response or who needs to be told, so you supply that reality.

Remember this

Decide it all in advance, for the same reason a fire drill happens before the fire.
